

Autopower Roll Cage on a Texas Build

Posted by Tabbasco - 05 Mar 2012 10:28

I have an autopower cage I planned to install and eventually upgrade but for the time being is the autopower cage legal and does it need to be supplemented with extra bars?

I saw some accident pictures (not pretty) with a modified autopower cage and someone said the cage can be grandfathered in??

Any clarification would be nice, and BTW I have read and reread the regs on this site.

You can see how the angle of the bar coming in is off from the "post" off the A pillar. If I were to let the bar sit "naturally," it would be above the post it joins to. The angle is bad enough that I can't get the coupling to move into place and bolt it down. The lower bar on this side (and both on the other side) went in without any trouble.

This is why I internally sleeved the cage and it took me having to keep the entire cage loose until I pushed it all together...it took hours to use rubber mallets to make it all come together.

Plus someone added a door bar to your cage which makes it even harder to get back together...
